To: John P. Saad Site Files Site #19-533

From: Robert L. Powell - TDSF Project Manager/Geologist

Subject: Update on EPA Removal Program Activities

At 9:34 At I called Rita Ford, Onsite Coordinator with the EPA Removal Program, and asked her about the current status of the Saad site. She told me that sampling of the waste sludge in the one cut up tank and contents of the other above ground tanks had revealed only waste oil constituents and no hazardous wastes (including PCBs). I asked her the proposed gameplan for the site and she informed me that it would be approached in two phases as follows:

1) The above ground tank contents and the oil/sludge on the surface will be removed initially as part of Phase I. This material will be going to Rollins or Tricil.

2) The above ground tanks will be cut up and disposed of properly. Also during this phase the sinkhole will be investigated further. Also the soils on site around the tanks will be sampled for possible remediation. This will be conducted as part of Phase II.

6-11-90

The above work is being addressed by the PRP's. Since the site didn't make the NPL list she was not aware of any RI/FS concerns. She did say that the Removal Program wouldn't be addressing the groundwater contamination issue. She said that a work plan was on the way for the tank contents removal and that she would route a copy up to us. Also I requested a copy of any analytical results that were available, and she said that they would be forwarded.
